IN REPLY
REFER TO: Joint Interoperability Test Command (JTE)

9 Mar 10

MEMORANDUM FOR DISTRIBUTION

SUBJECT: Special Interoperability Test Certification of the Unique Communications Configuration Accounting Information Retrieval System (CAIRS) with Software Release 4.0

References: (a) DOD Directive 4630.5, "Interoperability and Supportability of Information Technology (IT) and National Security Systems (NSS)," 5 May 2004
(b) CJCSI 6212.01C, "Interoperability and Supportability of Information Technology and National Security Systems," 8 March 2006
(c) through (e), see Enclosure 1

1. References (a) and (b) establish the Defense Information Systems Agency, Joint Interoperability Test Command (JITC), as the responsible organization for interoperability test certification.

2. The Unique Communications CAIRS with Software Release 4.0 is hereinafter referred to as the system under test (SUT). The SUT met the interface and functional requirements for a Customer Premises Equipment (CPE) telecommunications management system as set forth in Reference (c). The SUT is certified only with specified Nortel, Alcatel-Lucent, and Avaya digital switching systems listed within this document and listed on the Unified Capabilities (UC) Approved Products List (APL). Only the Work Order Processing and Response (WOPR) Automatic Switch Interface (ASI), Universal Collection Engine (UCE), and Morale Call Minder System were tested and are certified by the JITC. The SUT also offers the following applications but were not tested or certified by the JITC: Call Accounting, Web Work Order, Enhanced WEB 411, Unique Financial System, Unique Call Identification (UCID)911, and Subscriber Portal. Testing was conducted using test procedures derived from Reference (d). No other configurations, features, or functions, except those cited within this report, are certified by the JITC. This certification expires upon changes that affect interoperability, but no later than three years from the date of this memorandum.

3. This finding is based on interoperability testing conducted by JITC, review of the vendor's Letters of Compliance (LoC), and Defense Information Assurance (IA)/Security Accreditation Working Group (DSAWG) accreditation. Interoperability testing was conducted by JITC at the Global Information Grid Network Test Facility, Fort Huachuca, Arizona, from 31 August through 18 September 2009. Review of the vendor's LoC was completed on

JITC Memo, JTE, Special Interoperability Test Certification of the Unique Communications Configuration Accounting Information Retrieval System (CAIRS) with Software Release 4.0

30 September 2009. DSAWG grants accreditation based on the security testing completed by DISA-led IA test teams and published in a separate report, Reference (e). DSAWG accreditation was granted on [XX February 2010](#).

4. The SUT is certified with all software versions of the digital switching systems depicted in Table 1 which are on the UC APL. Functional Requirements used to evaluate the interoperability of the SUT and the interoperability statuses are depicted in Table 2.

Table 1. SUT Certified Switching System Configurations

Switch Name (See note.)	Network Management Functions	Interface	
Nortel CS2100	Fault Management, Configuration Management, Automated Message Accounting, and Performance Management	EIA-232 Serial Asynchronous	
Nortel CS1000M, CS1000M-SG, Succession DSN M1 Option 61C, and Succession DSN M1 Option 81C	Fault Management, Configuration Management, Automated Message Accounting, and Performance Management	EIA-232 Serial Asynchronous	
Nortel CS1000E, CS1000M-Cabinet, CS1000M-Chassis, Succession DSN M1 Option 11C Cabinet, and Succession DSN M1 Option 11C chassis	Fault Management, Configuration Management, Automated Message Accounting, and Performance Management	EIA-232 Serial Asynchronous	
Alcatel-Lucent 5ESS, CDX	Fault Management, Configuration Management, Automated Message Accounting, and Performance Management	EIA-232 Serial Asynchronous	
Alcatel-Lucent 5ESS VCDX	Fault Management, Configuration Management, Automated Message Accounting, and Performance Management	IEEE 802.3u Ethernet	
Avaya S8720, S8710, S8700	Fault Management, Configuration Management, Automated Message Accounting, and Performance Management	IEEE 802.3u Ethernet	
NOTE: The SUT is certified with all software versions of these digital switching systems which are listed on the UC APL with one exception: The SUT is certified with the Nortel CS2100 with the TDM interfaces only. This excludes VoIP end instruments and the MG9K IP Gateway.

2-Wire Analog (GR-506-CORE)	No ¹	Yes	MLPP in accordance with UCR, Section 5.2.2 (C)	Met	5.2.12.3.5
			FCC Part15/Part 68 (R)	Met	5.2.12.3.5
			DTMF outpulsing in accordance with GR-506-CORE (C)	Met	5.2.12.3.5, 5.2.4.4.1, 5.2.4.4.2
			DISR compliance as applicable (R)	Met	5.2.12.3.5
			Devices that support auto answer shall be setttable for four ROUTINE rings in accordance with UCR, Section 5.2.2.3 (C)	Met	5.2.12.3.5
			Devices that support precedence calls above ROUTINE precedence, shall respond properly to an incoming alerting (ringing) precedence call cadence as described in UCR 2008, Section 5.2.4.5.1, Ringing.(C)	Met	5.2.12.3.5
			EIA/TIA-470-B (R)	Met	5.2.12.3.5.2
	Yes	Yes	Security (R)	See note 2.	Section 3

NOTES:

1 The SUT is a CPE device that provides network monitoring functions. Therefore, the SUT interfaces are based on the UCR, section 5.2.8.1. The Network Management interoperability requirement can be met with any of the following interfaces: Ethernet, asynchronous serial, or synchronous serial. The functional requirements are based on the UCR, sections 5.2.8 and 5.2.12.3.

2 Security is tested by DISA-led Information Assurance test teams and published in a separate report, Reference (e).

CERTIFICATION TESTING SUMMARY

1. SYSTEM TITLE. Unique Communications Configuration Accounting Information Retrieval System (CAIRS) with Software Release 4.0; hereinafter referred to as the system under test (SUT).

2. PROPONENT. Space and Naval Warfare (SPAWAR) Assistant Program Manager for Shore Telephony.

3. SPONSOR. Ms. Shirley Dolengo, PEO C4I PMW 790, OT4 Room 2043
4301 Pacific Highway San Diego, CA 92110, e-mail: shirley.dolengo@navy.mil.

4. TESTER. Joint Interoperability Test Command (JITC), Fort Huachuca, Arizona.

5. SYSTEM UNDER TEST DESCRIPTION. The SUT manages small, medium, and large scale enterprise networks from local, regional, and central locations. The SUT can be modularly configured to allow sites to choose various configurations to meet their specified requirements. The SUT functions as a central telecommunications management system and database which includes:

- work orders/trouble tickets
- asset management
- switch assignments

The SUT web integrated work order deployment system provides customers and users the ability to track work order progress from the request to final implementation.

The SUT offers the following applications: Work Order Processing and Response (WOPR) Automatic Switch Interface (ASI), Universal Collection Engine (UCE), Call Accounting, Web Work Order, Enhanced WEB 411, Unique Financial System, Morale Minder System, Unique Call Identification (UCID)911, and Subscriber Portal. Only the WPOR, ASI, UCE, and Morale Call Minder System were tested and are certified by the JITC. The SUT is composed of the following components:

a. Database Server. The Database Server is a Microsoft Structured Query Language (SQL) 2005 Server, which runs on Windows Server 2003 SP2. All database transactions from CAIRS 4.0 are logged on the Database Server to include activity logs, security logs, and call data.

b. Fault and Reporting Server. The Fault and Reporting Server is a centralized monitoring and performance analysis system for the Private Branch Exchange (PBX) and switch devices located throughout the infrastructure. The Fault and Reporting Server provides all actions for centralized alarming, notification, logging and performance reporting by providing a unified interface to monitor the infrastructure in a graphical manner.

c. Application Server. The Application Server is the primary platform and central system for all CAIRS 4.0 modules. The CAIRS 4.0 CAIRS Enterprise Server (CES) is a centralized management system that manages system functionality, subscriber and directory administration, order and trouble ticket administration, device management, cable connectivity management, switch administration, inventory management, and billing management. The CAIRS 4.0 CES uses Active Server Pages (ASP).NET web services to connect to all CAIRS 4.0 enterprise clients, and Windows services to perform server side processes such as scheduling and WOPR-ASI connectivity. The Application Server uses a UCE, which collects call records, traffic, and alarm data from the PBX switch as well as Secure Maintenance Access (SMA), which is a terminal emulator that allows for secure remote access for administration of the PBX switch. The CAIRS 4.0 CES is built on the Microsoft .NET Framework 2.0, runs on the Internet Information Services (IIS) 6.0 server, and uses Microsoft SQL Server 2005 as its database.

d. Management Workstation. The workstation is a site-provided standalone Personal Computer (PC), with Windows XP Pro SP3 or Windows Vista SP2 installed as the operating system and runs with Microsoft NET Framework 2.0. The workstation also contains the CAIRS Application, which is the primary interface for users and administrators.

e. CAIRS Connection Unit (CCU). The CCU acts as a remote communication/connection unit between the CAIRS Application and the PBX switch. The CCU uses WOPR-ASI, UCE, and SMA as the Application Server. The CCU is also required if the Morale Minder system is being used. The Morale Minder system allows for calls based on the minute amount established by the Morale Minder administrator, the call time values are monitored and then deducted from the calling party's minute balance electronically. Calls exceeding their allowed length are automatically disconnected. Reminders of total time used and remaining minutes, inform the callers before calls are disconnected.

f. Teleboss 850. The Teleboss 850 is a Unix-based buffer box used in conjunction with the Application and Database Server to act as a buffer agent for call records and a secure pass through device to the PBX and switches. The Teleboss 850 acts as an Internet Protocol (IP) to serial terminal server that collects, buffers, and distributes data from the site's telephony infrastructure. It also supports the monitoring of collected data for traffic patterns and then makes proper notifications based on configured traffic situations.

6. OPERATIONAL ARCHITECTURE. The Unified Capabilities Requirements (UCR) Defense Switched Network (DSN) architecture in Figure 2-1 depicts the relationship of the SUT to the DSN switches.

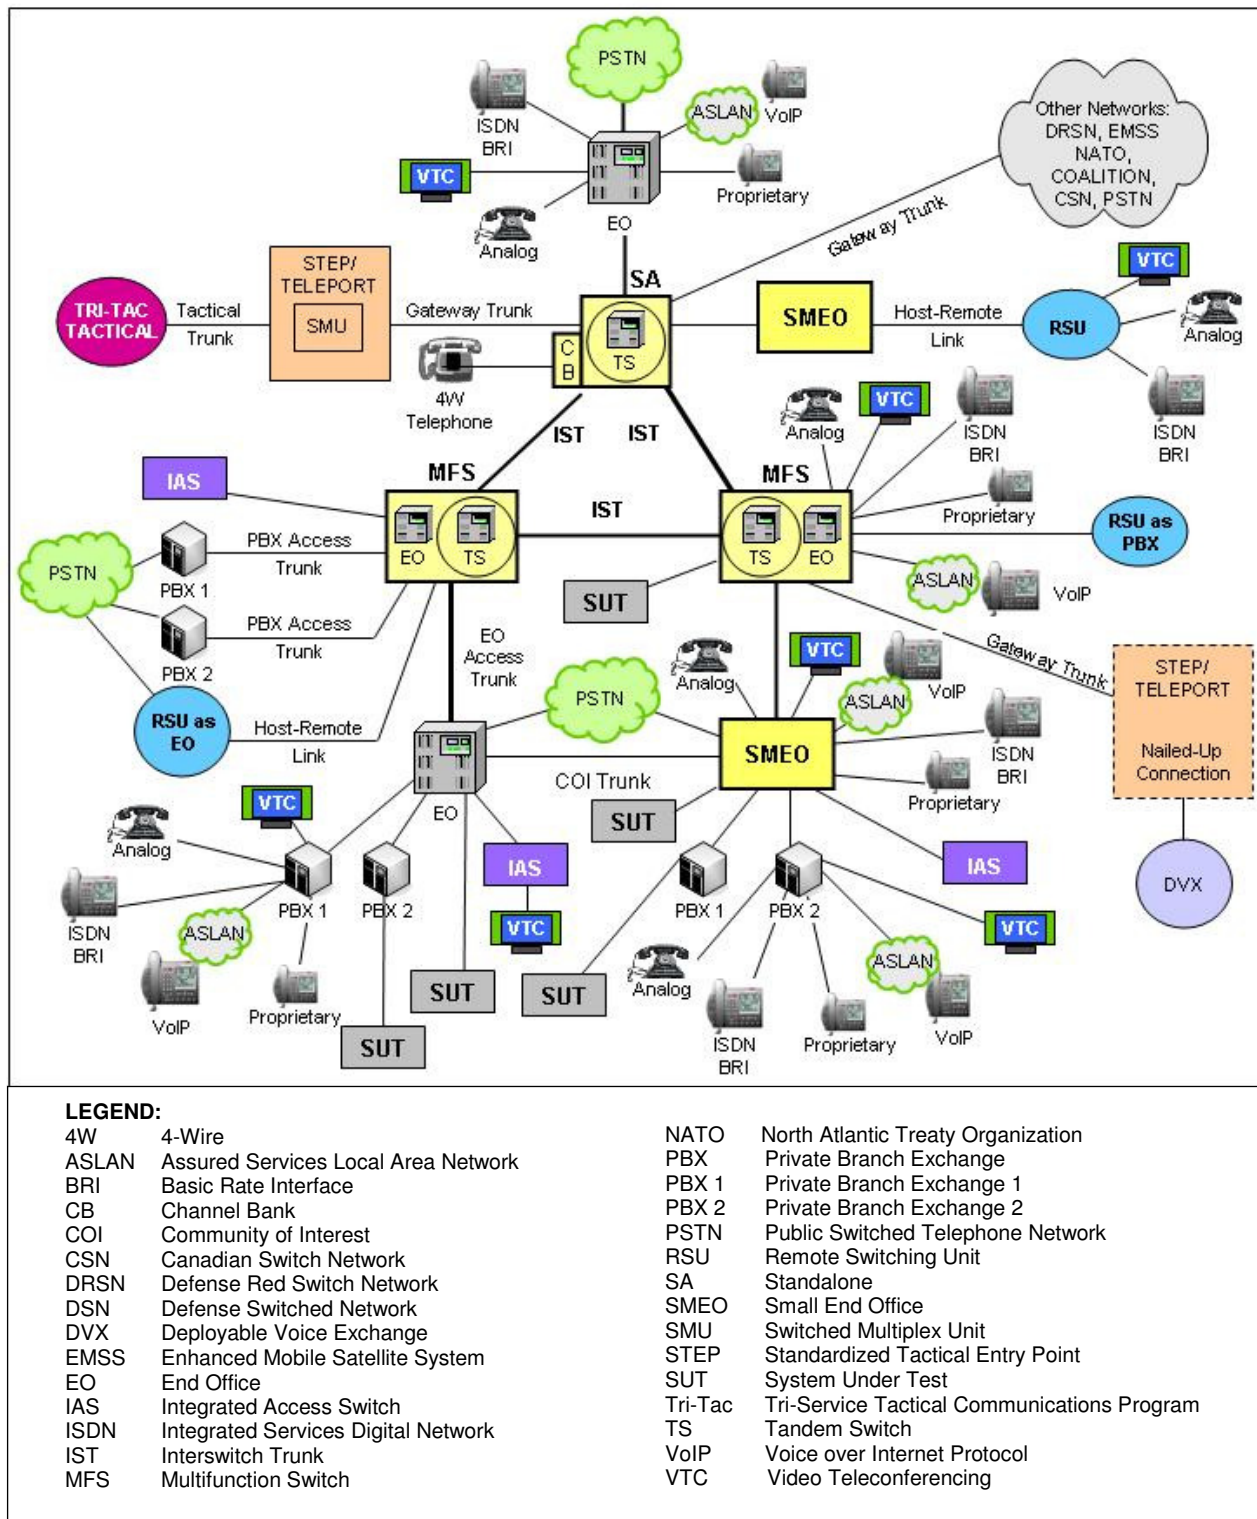

Figure 2-1. DSN Architecture

7. REQUIRED SYSTEM INTERFACES. Requirements specific to the SUT and interoperability results are listed in Table 2-1. These requirements are derived from Reference (c) and verified through the test procedures listed in Reference (d) and vendor submission of Letters of Compliance (LoC).

Table 2-1. SUT Functional Requirements and Interoperability Status

Interface	Critical	Certified	Functional Requirements	Status	UCR Reference
Serial EIA-232	No ¹	Yes	In accordance with EIA-232 (C)	Met	5.2.8.1

			DISR compliance as applicable (R)	Met	5.2.12.3.5
			Devices that support auto answer shall be settable for four ROUTINE rings in accordance with UCR, Section 5.2.2.3 (C)	Met	5.2.12.3.5
			Devices that support precedence calls above ROUTINE precedence, shall respond properly to an incoming alerting (ringing) precedence call cadence as described in UCR 2008, Section 5.2.4.5.1, Ringing.(C)	Met	5.2.12.3.5
			EIA/TIA-470-B (R)	Met	5.2.12.3.5.2
	Yes	Yes	Security (R)	See note 2.	Section 3

NOTES:

- 1 The SUT is a CPE device that provides network monitoring functions. Therefore, the SUT interfaces are based on the UCR, section 5.2.8.1. The Network Management interoperability requirement can be met with any of the following interfaces: Ethernet, asynchronous serial, or synchronous serial. The functional requirements are based on the UCR, sections 5.2.8 and 5.2.12.3.
- 2 Security is tested by DISA-led Information Assurance test teams and published in a separate report, Reference (e).

8. TEST NETWORK DESCRIPTION. The SUT was tested at JITC's Global Information Grid Network Test Facility in a manner and configuration similar to that of the DSN operational environment. Testing the system's required functions and features was conducted using the test configurations depicted in Figures 2-2 through 2-6. Figure 2-2 depicts the Nortel Communication Server (CS)1000M/CS2100 serial interface test configuration. Figure 2-3 depicts the Alcatel-Lucent Class 5 Electronic Switching System (5ESS) Compact Digital Exchange (CDX) serial interface test configuration. Figure 2-4 depicts the Alcatel-Lucent 5ESS Very Compact Digital Exchange (VCDX) IP interface test configuration. Figure 2-5 depicts the Avaya S8720 IP interface test configuration. Figure 2-6 depicts the SUT Morale Minder System test configuration.

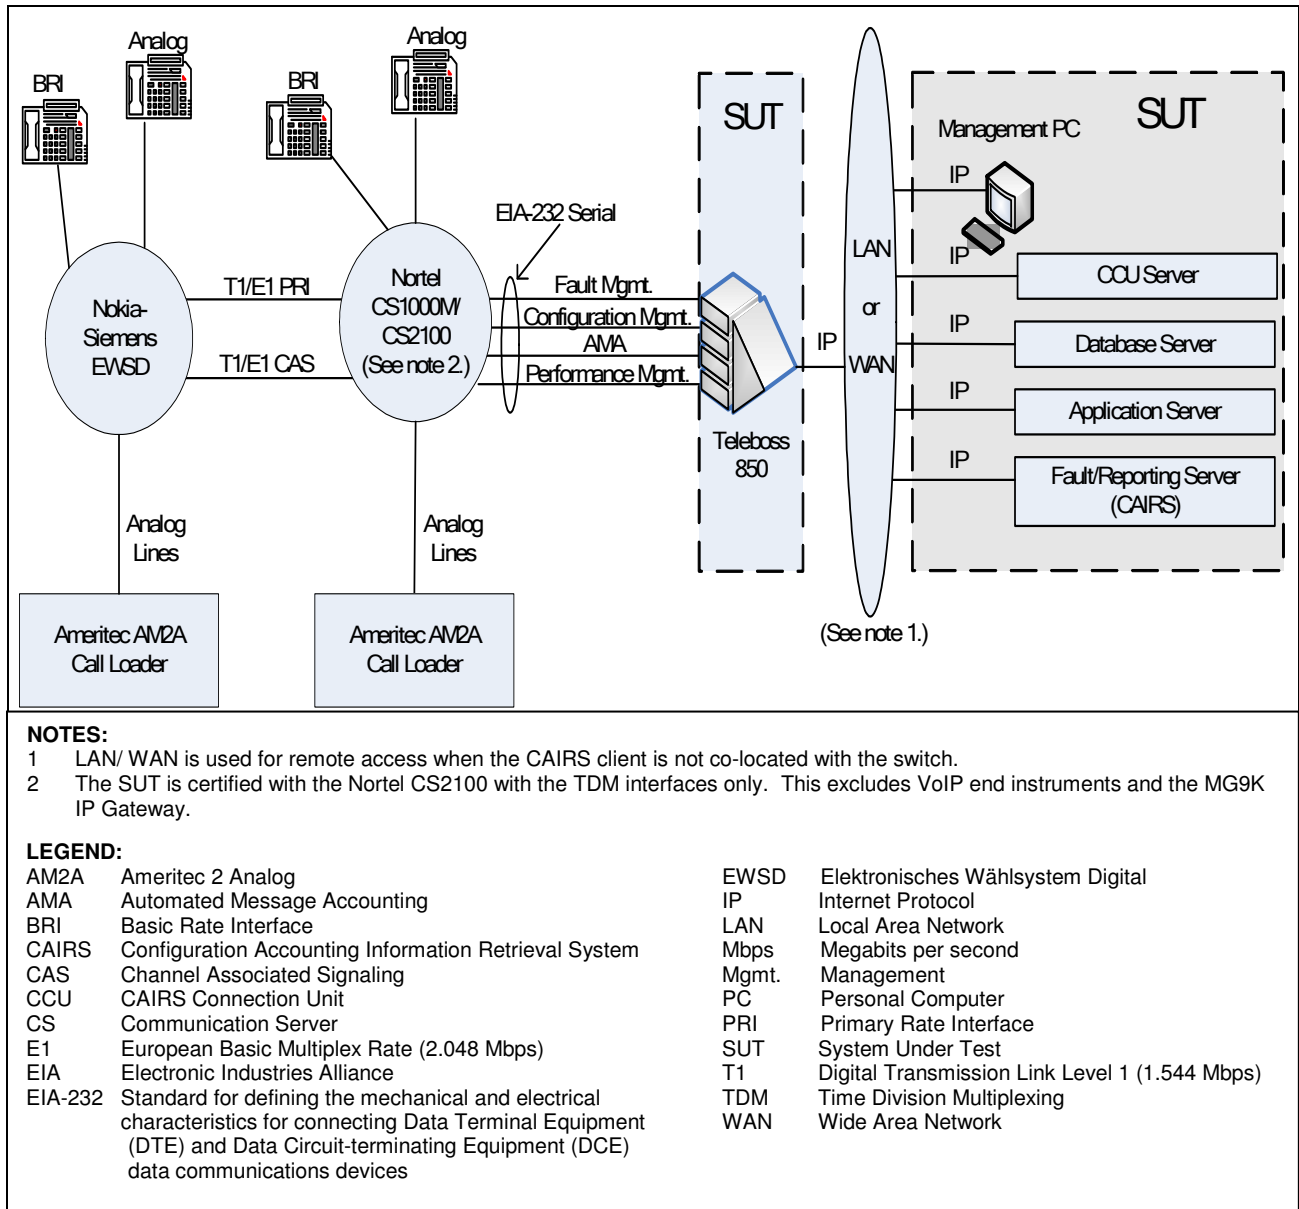

Figure 2-2. SUT Nortel CS1000M/CS2100 EIA-232 Serial Test Configuration

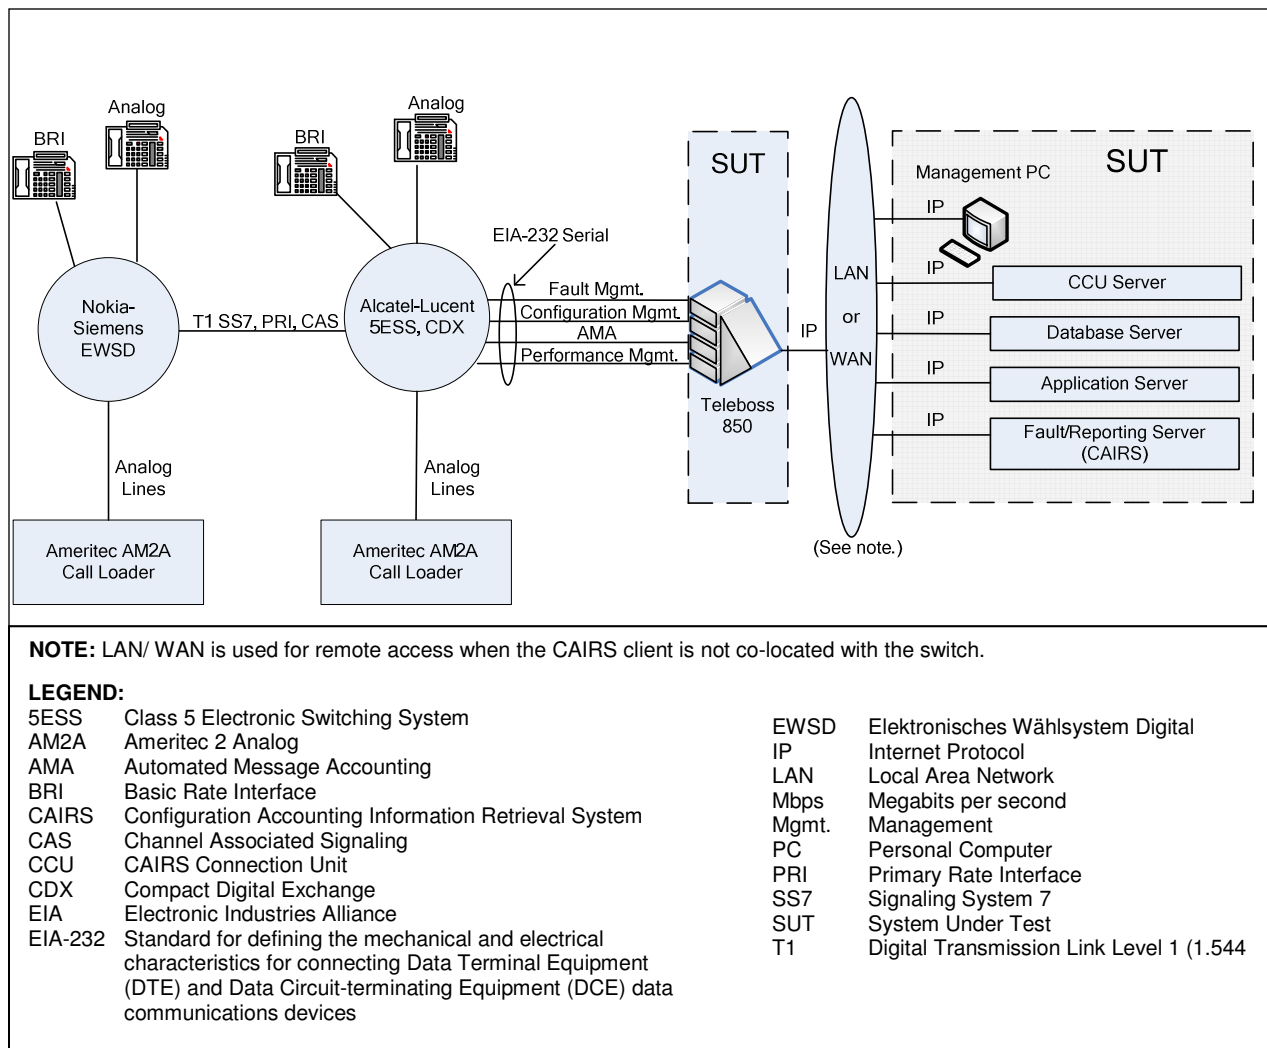

Figure 2-3. SUT Alcatel Lucent 5ESS CDX EIA-232 Serial Test Configuration

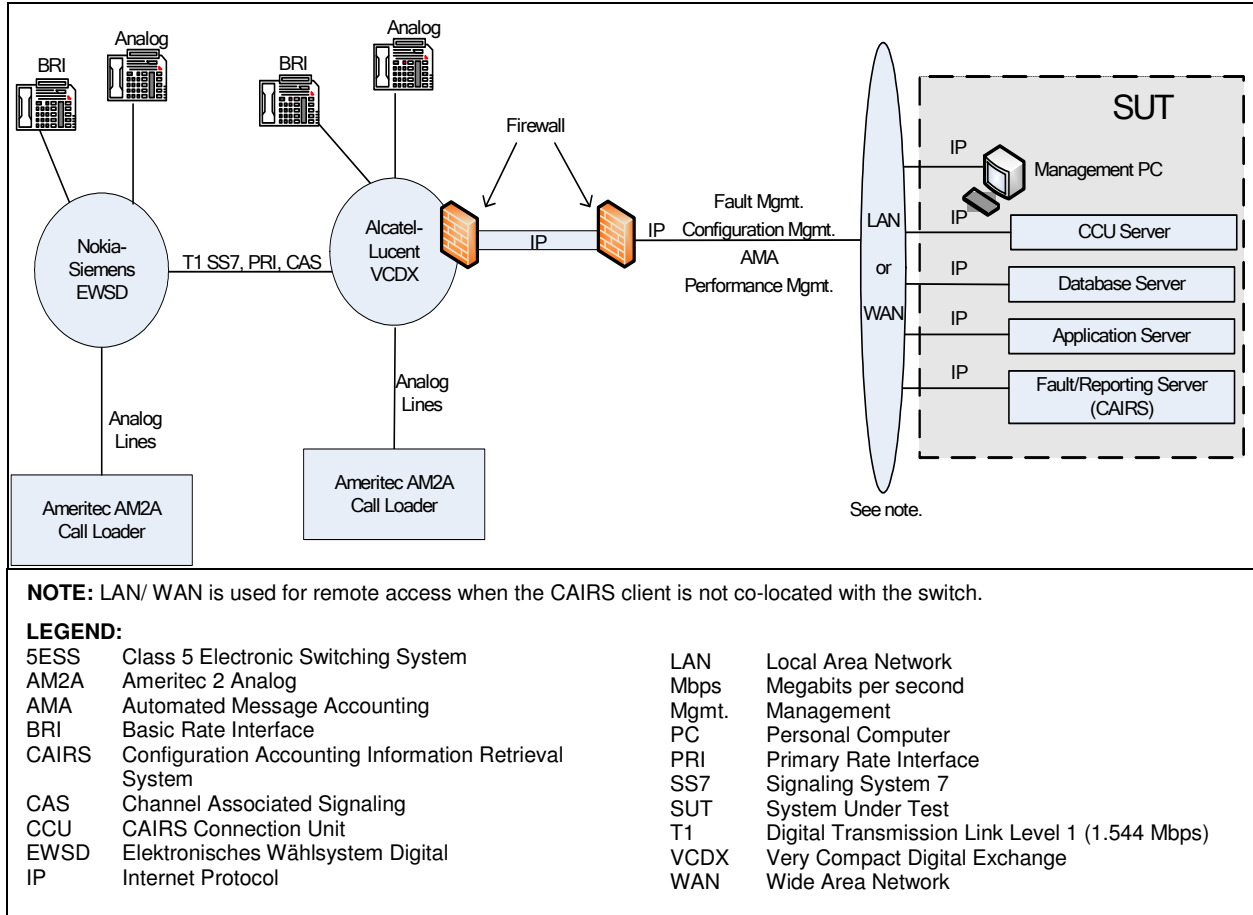

Figure 2-4. SUT Alcatel Lucent 5ESS VCDX IP Test Configuration

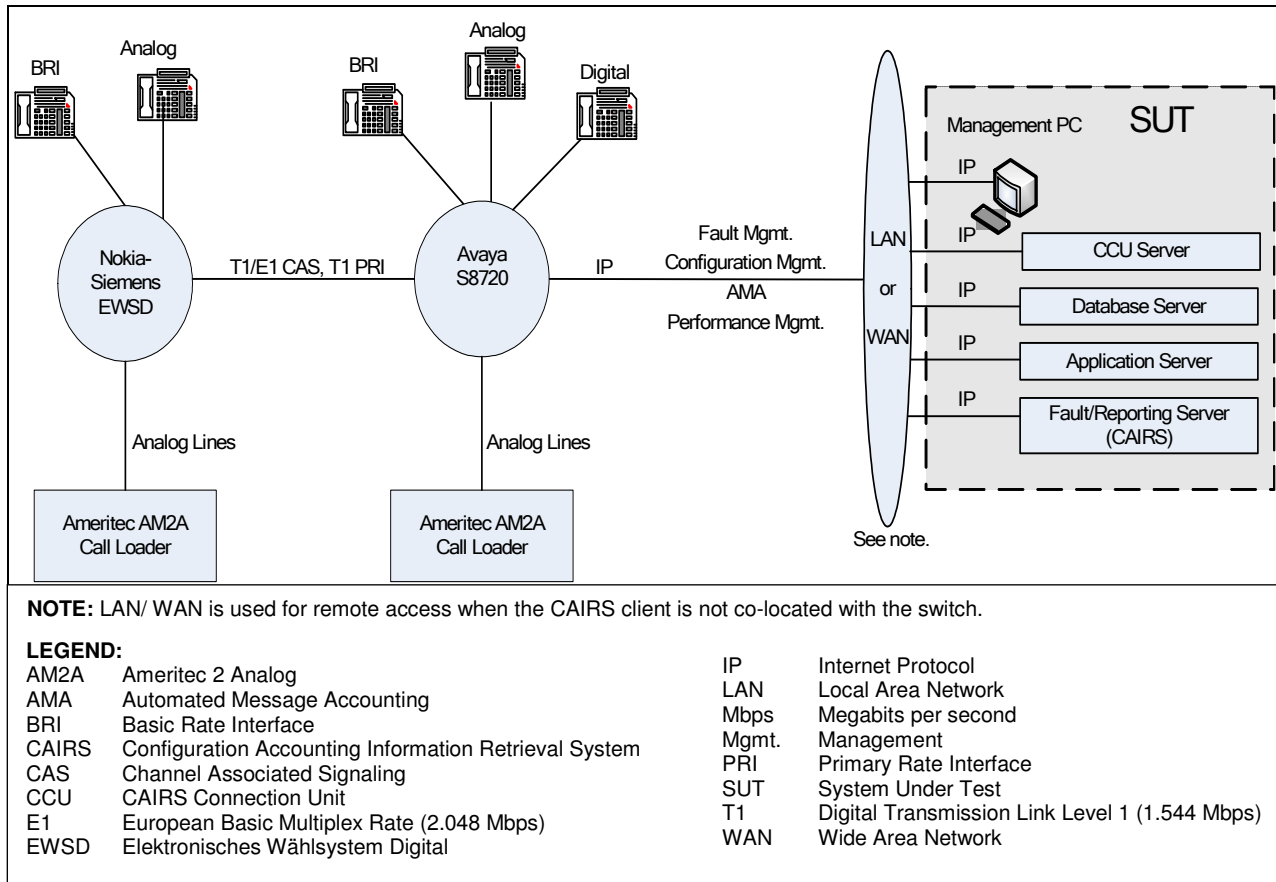

Figure 2-5. SUT Avaya S8720 IP Test Configuration

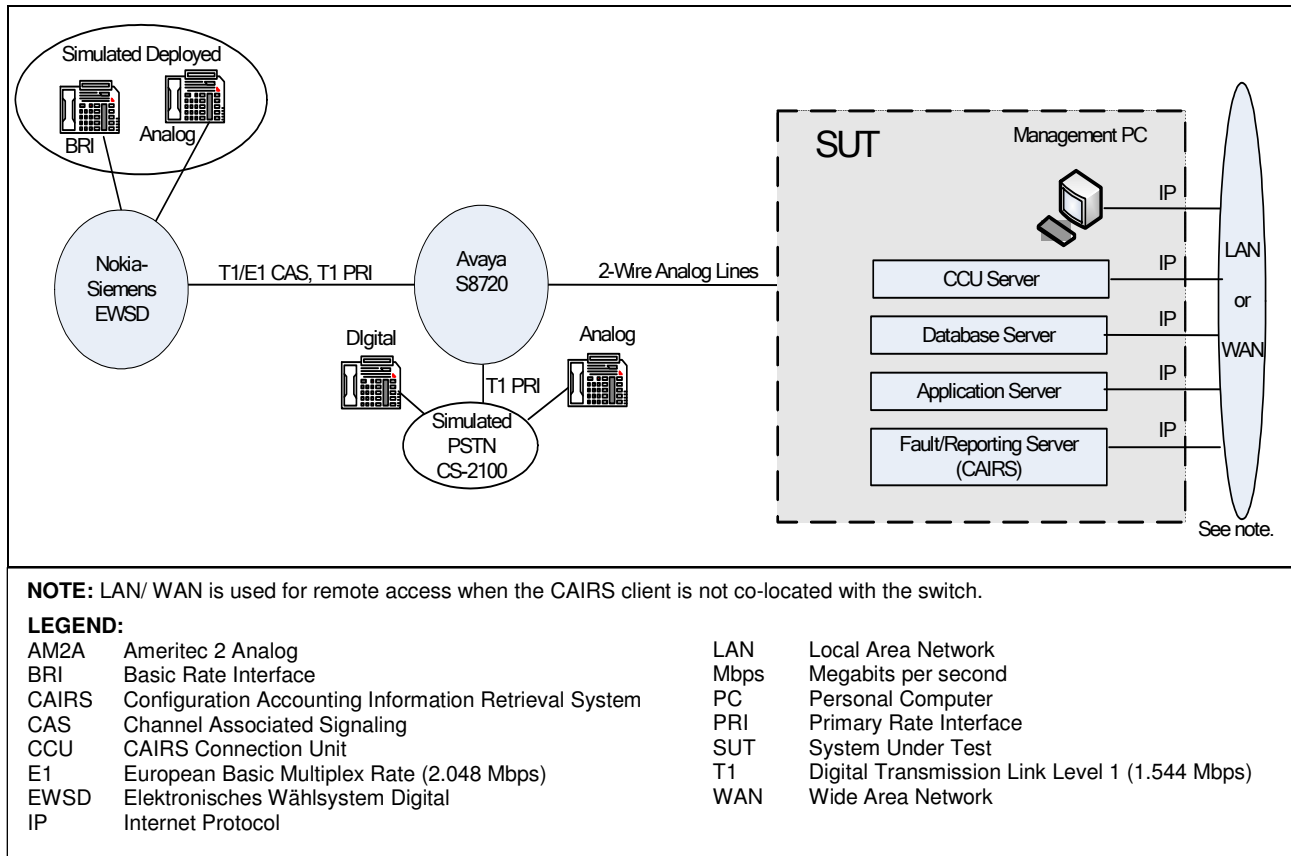

Figure 2-6. SUT Morale Minder System Test Configuration

9. SYSTEM CONFIGURATIONS. Table 2-2 provides the system configurations, hardware, and software components tested with the SUT. The SUT was tested in an operationally realistic environment to determine interoperability with a complement of DSN switches noted in Table 2-2. Table 2-2 lists the DSN switches which depict the tested configuration and is not intended to identify the only switches that are certified with the SUT. The SUT is certified with switching systems listed in Table 2-3 which are on the Unified Capabilities (UC) Approved Products List (APL).

Table 2-2. Tested System Configurations

System Name	Hardware/Software Release

10. TEST LIMITATIONS. None.

11. TEST RESULTS

a. Discussion. The SUT Morale Minder application offers the Warfighter the ability to place morale, welfare, and recreation (MWR) calls from a deployed location and connect to a local Public Switched Telephone Network (PSTN) telephone number at their home base, post, camp, or station. The caller is prompted by the SUT for a Personal Identification Number (PIN) and then the caller can dial a local PSTN number to connect to the specified destination. Once the caller is connected the SUT will activate a timer that will notify the caller at specified increments and will ultimately disconnect the call after it expires. Simulated MWR calls were placed to the SUT from various DSN switching systems and then extending to a dialed telephone subscriber over the test network depicted in Figure 2-6. Once calls were completed to the SUT, they were preempted within the simulated DSN to insure that the proper preemption action occurred as required by the UCR, section 5.2.2. All preempted calls received the proper preemption notification tone and were released and returned to an idle state ready for the subsequent caller. In addition the SUT Network Management (NM) feature and capability requirements listed in the UCR, section 5.2.8, were tested to various DSN switches as depicted in Figures 2-3 through 2-5. The SUT was tested with these requirements as the NM system connected to the DSN switches.

(1) In accordance with the UCR, section 5.2.8.1, DSN switching systems shall provide DSN NM data to the Advanced DSN Integrated Management Support System (ADIMSS) via one of the three following physical interfaces: Ethernet, serial asynchronous (Electronic Industries Alliance [EIA]-232, or serial synchronous International Telecommunication Union - Telecommunication Standardization Sector [ITU-T] X.25. The SUT, as a telecommunications management system, met all critical interoperability certification requirements for physical interfaces with Ethernet and EIA-232.

(2) In accordance with the UCR, section 5.2.8.3, the DSN telephone switching systems shall detect fault conditions and generate alarm notifications. In addition to the data formats in UCR, section 5.2.8.1, alarms may be sent as Simple Network Management Protocol (SNMP) traps. The SUT met all critical interoperability certification requirements for Fault Management. Alarm notifications and log messages were captured and saved to the database server.

(3) In accordance with the UCR, section 5.2.8.4, Configuration Management in a switching system shall be in accordance with Telcordia Technologies GR-472-CORE, Network Element Configuration Management, Revision 2, Feb. 1999, Section 4. The SUT met all critical interoperability requirements for Configuration Management by connecting to the switching systems remotely and emulating their local maintenance terminals.

(4) In accordance with the UCR, section 5.2.8.5, the Automated Message Accounting (AMA) process in a switching system provides usage related data to perform customer billing and Call Detail Recording (CDR). The SUT met all critical interoperability requirements for AMA by collecting and storing CDR data on the database server.

(5) In accordance with the UCR, section 5.2.8.6, the DSN switches must meet the switch performance data requirements in the UCR, Table 5.2.8-2. The SUT met all critical interoperability requirements for Performance Management by collecting and accurately storing traffic data measurements on the database server at various time intervals (e.g. 5-, 15-, 30-minutes) as supported by the respective switches.

(6) In accordance with UCR, section 5.2.12.3.5, device(s) that support auto-answer shall have an "Auto-Answer" mode settable to a "time" more than the equivalency of four ROUTINE precedence ring intervals in accordance with UCR 2008, section 5.2.2.3, before "answer" supervision is provided. Handling of the precedence calls will be in accordance with UCR 2008, section 5.2.2.2.4.2. The SUT was able to set the auto answer to the equivalency of four ROUTINE rings which met this requirement. The SUT properly diverted precedence calls above ROUTINE to the global diversion default (e.g. attendant console, alternate directory number, night service) prior to the fourth ring.

(7) In accordance with the UCR, section 5.2.12.3.5, all DSN Customer Premise Equipment as a minimum, must meet the requirements of Part 15 and Part 68 of the FCC Rules and Regulations, and the Administrative Council for Terminal Attachments (ACTA). This requirement was met by the SUT with a vendor's LoC.

(8) In accordance with the UCR, section 5.2.12.3.5, all DSN Customer Premise Equipment Device(s) that can "out-dial" Dual Tone Multifrequency (DTMF) and/or Dial Pulse (DP) digits (automatic and/or manual) shall comply to the requirements as stated in UCR 2008, Section 5.2.4.4.1, Dial-Pulse Signals, and Section 5.2.4.4.2, DTMF

Signaling, respectively, for its address digit generating capabilities and shall be capable of outpulsing DTMF digits specified in Telcordia Technologies GR-506-CORE, *Signaling for Analog Interfaces*, Issue 1 with Revision 1, June 1996. The SUT supports DTMF signaling and met this requirement with a vendor's LoC.

(9) In accordance with the UCR, section 5.2.12.3.5.2, CPE(s) that use loop signaling shall conform to the requirements of TIA/EIA-470-B. The SUT supports 2-wire analog DTMF signaling interfaces and met this requirement with a vendor's LoC.

(10) In accordance with the UCR, Table 5.3.1-3, Operational Administration and Maintenance (OAM) IP packets shall be tagged with a Differentiated Services Code Point (DSCP) value of 16 to 23. Using the WireShark IP capture tool to capture DSCP tagging within the SUT enclave between the Teleboss 850, Application Server, Fault and Reporting Server, and CCU, it was determined that the SUT tagged the OAM packets at 0 which does not meet this requirement. However, this discrepancy was reviewed by DISA and was adjudicated as having a minor operational impact.

b. Test Summary. The SUT met the interface and functional requirements for a Customer Premises Equipment (CPE) telecommunications management system as set forth in Reference (c). Only the WPOR, ASI, UCE, and Morale Call Minder System were tested and are certified by the JITC. The SUT is certified specifically with switching systems and their respective interfaces listed in Table 2-3.

12. TEST AND ANALYSIS REPORT. No detailed test report was developed in accordance with the Program Manager's request. JITC distributes interoperability information via the JITC Electronic Report Distribution (ERD) system, which uses Unclassified-But-Sensitive Internet Protocol Router Network (NIPRNet) e-mail. More comprehensive interoperability status information is available via the JITC System Tracking Program (STP). The STP is accessible by .mil/gov users on the NIPRNet at <https://stp.fhu.disa.mil>. Test reports, lessons learned, and related testing documents and references are on the JITC Joint Interoperability Tool (JIT) at <http://jit.fhu.disa.mil> (NIPRNet), or <http://199.208.204.125> (SIPRNet). Information related to DSN testing is on the Telecom Switched Services Interoperability (TSSI) website at <http://jitc.fhu.disa.mil/tssi>.
